Natl. Acad. Sci. U.S.A. 100:8298-8303(2003).
-!- FUNCTION: This protein is essential for replication of the chromosome. It is also involved in DNA recombination and repair (By similarity).
-!- SIMILARITY: Contains 1 SSB domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gloeckner F.O., Kube M., Bauer M., Teeling H., Lombardot T., Ludwig W., Gade D., Beck A., Borzym K., Heitmann K., Rabus R., Schlesner H., Amann R., Reinhardt R., "Complete genome sequence of the marine planctomycete Firellula sp. strain 1.";

Int. Immunol. 10:631-637(1998).

Int. Immunol. 10:631-637(1998).

Int. Immunol. 10:631-637(1998).

Int. Immunol. Retards apoptosis induced by IL-3 deprivation. May function in the response of hemopoietic cells to external signals and in maintaining endothelial survival during infection.

Interest and interacellular.

Interest English Expressed in hemopoietic tissues, including bone marrow, spheen and thymus.

Induction: By granulocyte-macrophage colony-stimulating factor and LPS in macrophages.

Induction: By granulocyte-macrophage colony-stimulating factor and LPS in macrophages.

Induction: By granulocyte-macrophage colony-stimulating factor and LPS in macrophages.

Induction: By granulocyte-macrophage colony-stimulating factor and LPS in macrophages.

Induction: BRILLARITY: Contexing 1 BCl-2 homology 2 (BH1) domain.

Induction: SIMILARITY: Belongs to the BCl-2 family.
                                                                                                             STRAIN=CBA/J; TISSUE=Bone marrow;

A comparison of three distinct ferritin complementary DNAs, the corresponding subunits, and identification of
-i- TISSUE SPECIFICITY: Seems to be restricted to the hematopoietic compartment. Expressed in peripheral blood, spleen, and bone marrow, at moderate levels in lung, small intestine and testis, a minimal levels in other tissues. Also found in vascular smooth muscle cells and hematopoietic malignancies.
-i- INDUCTION: By phorbol ester and inflammatory cytokines, such as TNP-alpha, or IL-1-beta, but not by growth factors:
-i- SIMILARITY: Conteains 1 Bcl-2 homology 1 (BH1) domain.
-i- SIMILARITY: Belongs to the Bcl-2 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         01.AUG-1988 (Rel. 08, Created)

SUBMISSON L., Ray W.C., Mahairas G., Sabo P., Mungur R.,

Authoson L., Nguyen D., Wang J., Forst C., Hood L.;

The complete genome sequence of Haemophilus ducreyi.";

Submitted (UTN-2003) to the EMBL/GenBank/DDBJ databases

L. FUNCTION: Catalyzes a salvage reaction resulting in the formation of AMP, that is energically less costly than de novo synthesis.

C. I. CATALYTIC ACTIVITY: AMP + diphosphate = adenine + 5-phospho-alpha-

C. I. PATHWAY: Purine salvage.

C. I. STRUMYT: Homedimer (By similarity).

C. SUBUNT: Homedimer (By similarity).

C. SUBUNT: Belongs to the purine/pyrimidine

phosphoribosyltransferase family.

                                                                                                                                                                                                                            -!- FUNCTION: APPEARS TO BE THE POSITIVE ACTIVATOR OF UHPT TRANSCRIPTION.
-!- SUBCELLULAR LOCATION: CYtoplasmic (Probable).
-!- PTM: PHOSPHORYLATED BY UHPB (PROBABLE).
-!- SIMILARITY: COLTAINS 1 response requiatory domain.
-!- SIMILARITY: BELONGS TO THE LUXR/UHPA FAMILY OF TRANSCRIPTIONAL REGULATORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalia; Eutheria; Rodentia; Sciurognathi; Muridae; Musinae; Mus

J. Biol. Chem. 274:18470-18476(1999).
-!- FUNCTION: RNA-editing deaminase involved in somatic hypermutation, gene conversion, and class-switch recombination. Required for several crucial steps of B-cell terminal differentiation necessary for efficient antibody responses.
-!- CATALYTIC ACTIVITY: Cytidine + H(2)0 = uridine + NH(3).
-!- COFACTOR: Zinc (By similarity).
-!- COFACTOR: Zinc (By similarity).
                  "Specific expression of activation-induced cytidine deaminase (AID), a novel member of the RNA-editing deaminase family in germinal center B

Trocomplete genome of the crenarchaeon Sulfolobus solfstaricus P2.";

Trocomplete genome of the presentation of PRFAR and glutamine to IGP, AICAR and glutamate. The hisH subunit provides the glutamine amidetransferase activity that produces the ammonia necessary to hisF for the synthesis of IGP and AICAR (By similarity).

This CATALYITY: A CITYTY: - I (5-phospho-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deoxyribulos-1-deox
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This SWISS-PROT entry is copyright. DISEASE: Defects in RBP4 are a cause of retinol-binding protein deficiency [MIM:180250]. This condition causes night vision problems. It produces a typical "fundus xerophthalmicus," featuring a progressed atrophy of the retinal pigment epithelium. DISEASE: A deficiency of vitamin A blocks secretion of the binding supply of vitamin to the epidermal cells in defective delivery and supply of vitamin to the epidermal cells (a condition associated with a dermatosis).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CHARACTERIZATION OF VARIANTS ASN-59 AND ASP-93.

"Blochemical but not clinical vitamin A deficiency results from
mutations in the gene for retinol binding protein.";
Am. J. Clin. Nutr. 69:931-936(1999).
-!- FUNCTION: Delivers retinol from the liver stores to the peripheral
tissues. In plasma, the RBP-retinol complex interacts with
transthyretin, this prevents its loss by filtration through the
kidney glomeruli.
-!- SUBCELLULAR LOCATION: Secreted.
-!- MASS SPECTROMETRY: MW=21063.46; MW_ERR=1.88; METHOD=Electrospray;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 [12]

Nat. Struct. Balol. 7:224-229(2000).

-I. FUNCTION: REQUIRED FOR THE EXECUTION OF THE MITOTIC CHECKPOINT WHICH MONITORS THE PROCESS OF KINETOCHORE-SPINDLE ATTACHMENT AND DELAYS THE ONSET OF ANAPHASE WHEN THIS PROCESS IS NOT COMPLETE. IT INHIBITS THE ACTIVITY OF THE ANAPHASE PROMOTING COMPLETE. IT SEQUESTERING CDC20 UNTIL ALL CHROMOSOMES ARE ALIGNED AT THE METAPHASE PLATE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MEDLINE-9945864; PubMed-10527948;

"The complete sequence of a cucumber mosaic virus from Ixora that is deficient in the replication of satellite RNAs.";

Gen. Virol. 76:2257-2270 (1995).

-i. SIMILARITY: Belongs to the cucumoviruses/bromoviruses coat protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   IRON (HEME AXIAL LIGAND) (BY SIMILARITY).

E -> K (IN REF. 1).

A -> V (IN REF. 1).

A -> V (IN REF. 1).

N -> H (IN REF. 1).
-!- FUNCTION: Allows the bacteria to use the host heme as an iron source. Involved in the oxidation of heme and subsequent release of iron from the heme moiety.
-!- CATALYTIC ACTIVITY: Heme + 3 AH(2) + 0(2) = biliverdin + Fe(2+) + CO + 3 A + 3 H(2)0.
-!- SIMILARITY: Belongs to the heme oxygenase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Coat protein (Capaid protein) (CP).

Nature 390:364-370(1997).
-!- FUNCTION: Probably involved in degradation of a variety of RNA species; could act a RNA-binding component of the exosome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -i- SUBUNIT: Component of the archaeal exosome multienzyme ribonuclease complex (Potential).
-i- SUBCELLULAR LOCATION: (Stoplasmic (Potential).
-i- SIMILARITY: Contains 1 KH domain.
-i- SIMILARITY: Contains 1 S1 motif domain.
                                                                                                      Archaea; Buryarchaeota; Archaeoglobi; Archaeoglobales;
Archaeoglobaceae; Archaeoglobus.
    10-OCT-2003 (Rel. 42, Last sequence update)
10-OCT-2003 (Rel. 42, Last annotation update)
Probable exosome complex RNA-binding protein 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       EMBL; AE001070; AAB90745.1; -. -!- FUNCTION: COULD BE INACTIVE AS THE ACTIVE SITE CYSTEINE IS MODIFIED TO TRYPTOPHAN.
-!- CATALYTIC ACTIVITY: Protein tyrosine phosphate + H(2)O = protein tyrosine + phosphate.
-!- SIMILARITY: BELONGS TO THE NON-RECEPTOR CLASS OF THE PROTEIN-TYROSINE PHOSPHATASE FAMILY: CDC14 SUBFAMILY.
                                                                                                                                                                      Gaps

"Cloning of cDNAs encoding a cell-cycle-regulatory GTP-binding
"Cloning of cDNAs encoding a cell-cycle-regulatory GTP-binding
low-M(r) (GBLM) protein, Ran/TC4, from micronucleated Tetrahymena
thermophila and amicronucleated Tetrahymena pyriformis.";
Gene 144:123-125(1994).
-!- FUNCTION: GTP-binding protein involved in nucleocytoplasmic
transport. Required for the import of protein into the nucleus and
also for RNA export. Involved in chromatin condensation and
control of cell cycle (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    01-NOV-1995 (Rel. 32, Created)

"Complete nucleotide sequence of the Porphyra purpurea chloroplast
                                                                                                                                                                                                                                                                                                                                                                                                  genome.";
Plant Mol. Biol. Rep. 13:333-335 (1995).
-!- SUBUNT: Part of the 30S ribosomal subunit.
-!- SUBCELLULAR LOCATION: Chloroplast.
-!- SUBCELLULAR belongs to the S3P family of ribosomal proteins.
-!- SIMILARITY: Contains 1 KH type-2 domain.

                               "Complete genomic sequence of Corynebacterium glutamicum ATCC 13032.";
Submitted (MAY-2002) to the EMBL/GenBank/DDBJ databases.
-!-FUNCTION: Methyltransferase required for the conversion of
dimethylmenaquinone (DMKH2) to menaquinone (MKH2) (By similarity).
-!- CATALYTIC ACTIVITY: S-adenosyl-L-methionine + demethylmenaquinol = s-adenosyl-L-homocysteine + menaquinol.
-!- PATHWAY: Menaquinone blosynthesis; last step.
-!- SIMILARITY: Belongs to the ubiE family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
